Sandia National Laboratories is a multimission laboratory managed and operated by National Technology and Engineering Solutions of Sandia LLC, a wholly owned subsidiary of Honeywell International Inc. for the U.S. Department of Energy's National Nuclear Security Administration under contract DE-NA0003525.

Motivation and Background

- Existing fleet cybersecurity approach is wrap-around
 - “guns, gates, and guards”
- Current cybersecurity guidelines provide economic burden to operator
 - Large numbers of Critical Digital Assets (CDAs)
 - Site Acceptance Testing
 - Supply Chain management is difficult
- Advanced Reactor industry changing nuclear business case
 - Reduction of on-site security
 - Distributed / remote monitoring and possibly control

Project History and Overview

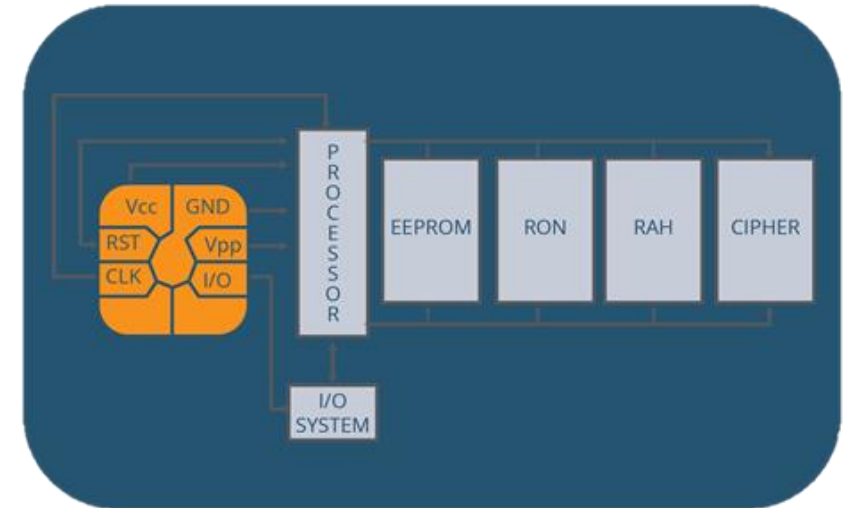

- Work began in FY22 as a supply chain threat mitigation study
 - Secure Element leveraged as potential for system fingerprinting
 - Provide “digital identity to physical device mapping” via digital signature and 1:1 relationship between public key and device
- FY23
 - Work to extend protection to runtime operations of Programmable Logic Controllers (PLCs)
 - PLC state monitoring tied closely with a Secure Element for trusted operational reporting
- Current FY24 Scope
 - Considering Field Programmable Gate Array (FPGA) based safety systems for architectures including Secure Elements

Secure Element – What is it?

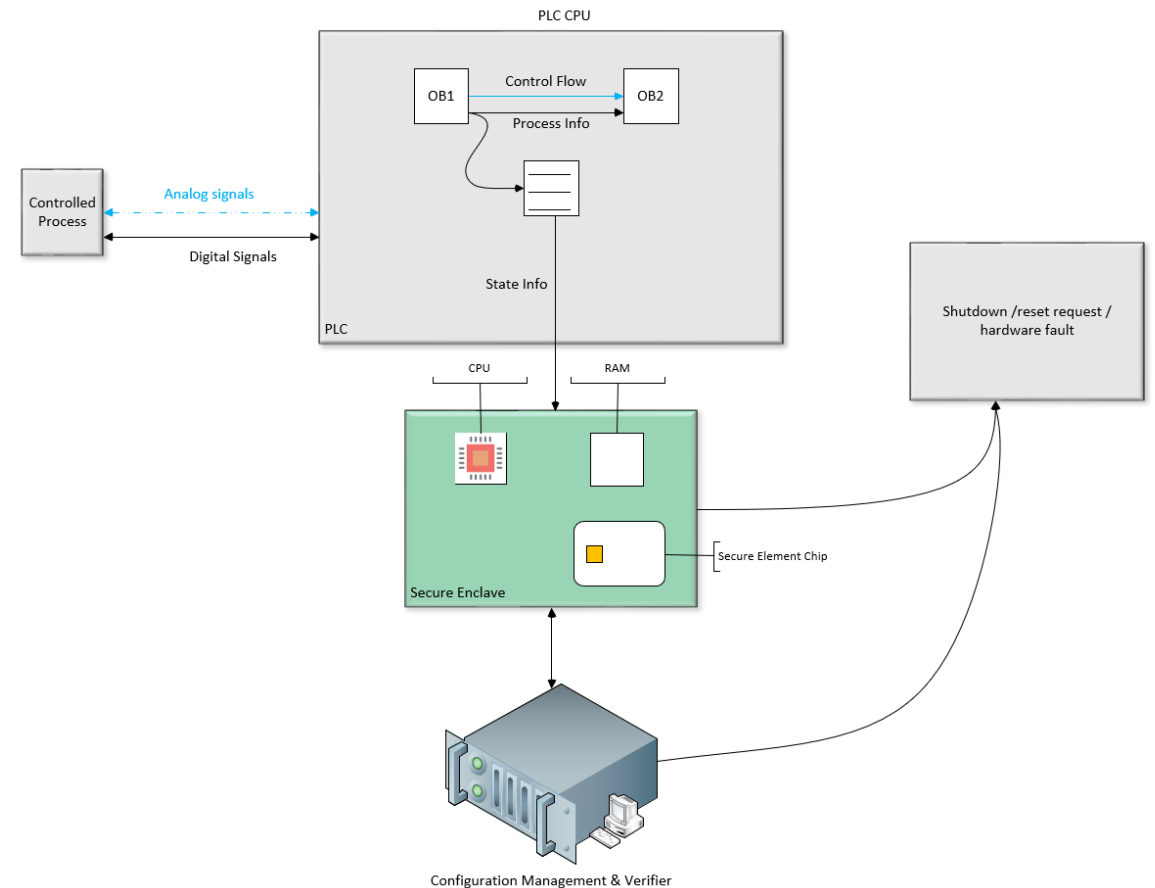

- Integrated circuit providing:
 - Tamper resistance
 - Cryptographic security
 - Secure offline storage
 - Assurance through Common Criteria
 - Economy of scale
- Common use cases:
 - Telecommunications
 - Device security (e.g. Trusted Platform Module)
 - Finance (e.g. credit cards)

Secure Element - Application

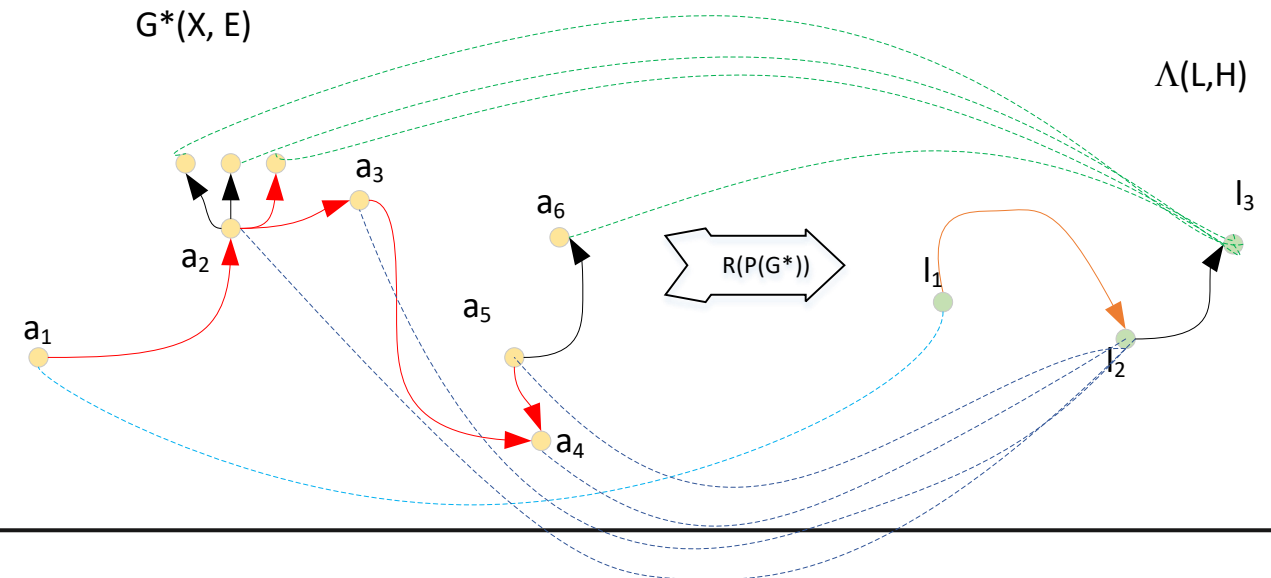

- Leveraged as **Hardware Root of Trust**
- Cryptographic assurance of origins and data confidentiality

Secure Element – Application

- Integrated SE-rooted cryptography into Commercial Off The Shelf (COTS) PLC
 - Siemens S7 1518
 - AES-GCM 256-bit encryption and MAC
- Trustworthy and secure reporting of asset-centric state information

FY23 Results

- Cryptographic performance acceptable for per-cycle state reporting in most demanding (1 ms cycle time) scenarios

AES Encryption Timings (Microseconds) as documented by Hung et al. (2018) vs. PLC implementation

FY24

- Focus on Field Programmable Gate Array (FPGA) based security systems
- FPGAs planned for use in safety systems for Advanced Reactors

FPGA Platforms

Platform	Safety Evaluation Report Approval	Country of Origin
Westinghouse ALS	2013	USA
Paragon / Rock Creek Innovations HIPS	2017	USA
Radiy RadICS	2019	Ukraine
Doosan HFC FPGA	2021	South Korea

FPGA Implications

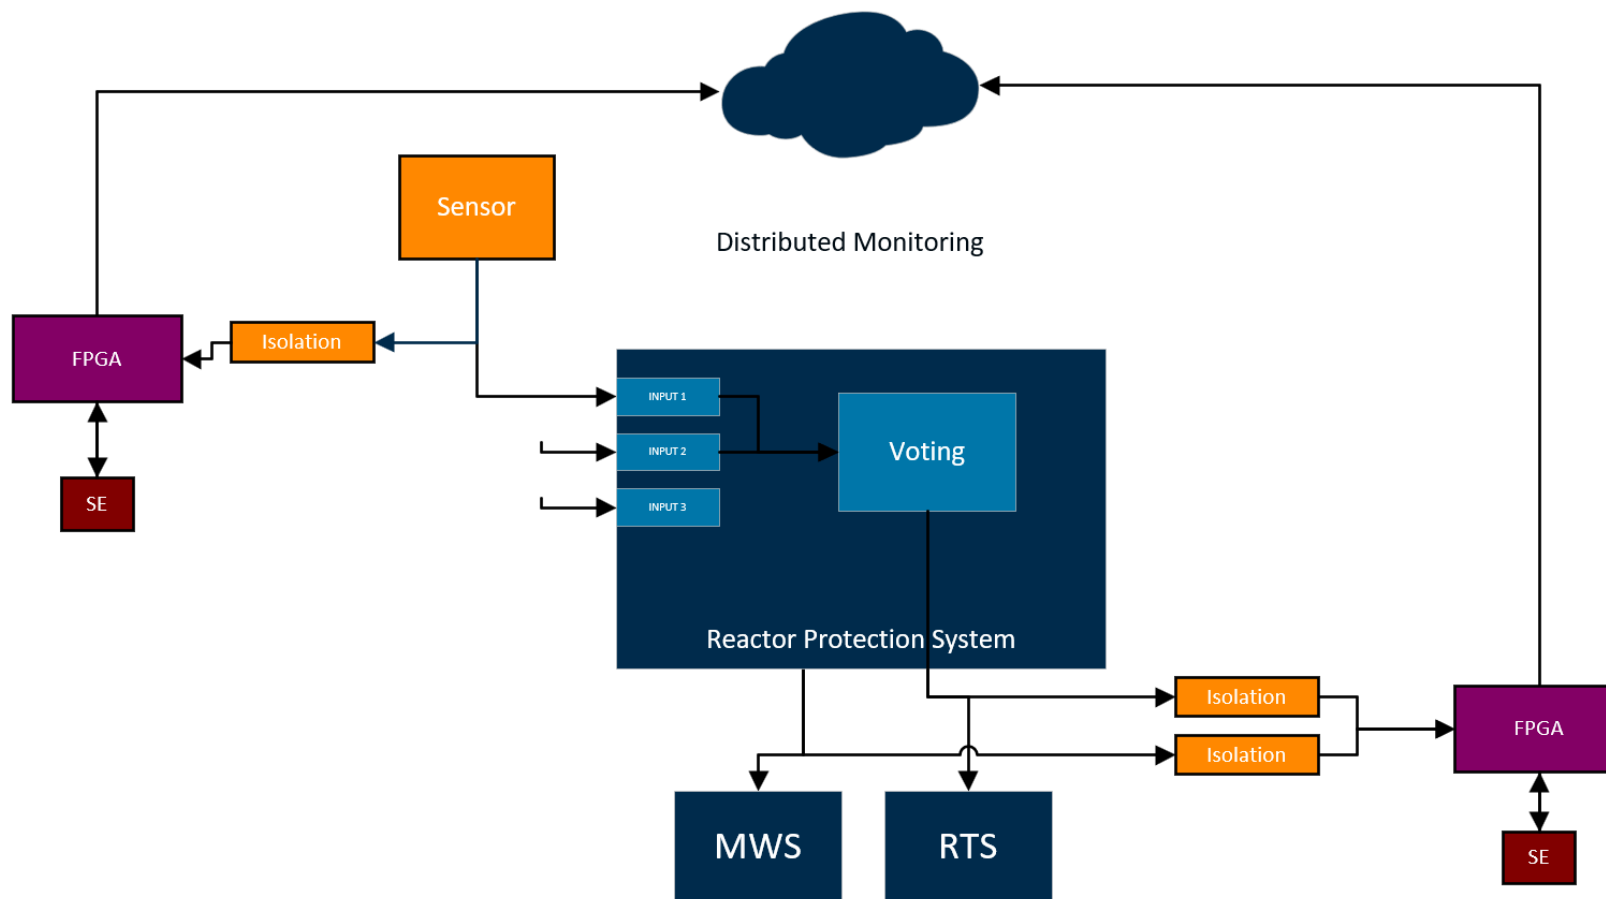

- Treated as “Software”
- Lack Operating System, Central Processing Unit, traditional boot operations
 - Secure Element integration becomes trickier due to client/server paradigm
- Relatively large number of distinct FPGAs in safety system design aiding in diversity and redundancy

Licensing Friendly(er)* Design Candidate

*maybe

Project Status and Future

- Development and initial testing underway with FPGA and Secure Element development board communication over inter-integrated circuit (i2c) protocol
- Testing performed on sample FPGA safety system
- ANS Annual Meeting panel session
- On schedule for final report

Thank You!
